BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

**As rescanning documents *will not* correct images,
please do not report the images to the
Image Problem Mailbox.**

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A liquid crystal display device in which a liquid crystal layer is interposed between a pair of substrates and in which a transmissive display region for transmissive display and a reflective display region for reflective display are provided within a single dot region, comprising:

~~wherein~~ the liquid crystal layer is being formed of liquid crystal with a negative dielectric anisotropy whose initial alignment state represents a vertical alignment, alignment;

~~_____~~ a thickness-adjusting layer of the liquid crystal layer which makes the thickness of the liquid crystal layer different in the reflective display region and the transmissive display region, is region being provided in at least the reflective display region between at least one of the pair of substrates and the liquid crystal layer, layer; and

~~_____~~ the thickness-adjusting layer of the liquid crystal layer has having an inclined plane in the vicinity of the boundary between the reflective display region and the transmissive display region, and electrodes are being provided on the inner sides of each of the pair of substrates respectively, with an opening being provided at a position corresponding to the inclined plane of the thickness-adjusting layer of the liquid crystal layer in the electrode on the substrate opposite to the side where the thickness-adjusting layer of the liquid crystal layer is provided among the electrodes on the pair of substrates.

2. (Currently Amended) A liquid crystal display device in which a liquid crystal layer is interposed between a pair of substrates and in which a transmissive display region for transmissive display and a reflective display region for reflective display are provided within a single dot region, comprising:

wherein the liquid crystal layer is being formed of liquid crystal with a negative dielectric anisotropy whose initial alignment state represents a vertical alignment, _____ a thickness-adjusting layer of the liquid crystal layer which makes the thickness of the liquid crystal layer different in the reflective display region and the transmissive display region, is region being provided in at least the reflective display region between at least one of the pair of substrates and the liquid crystal layer, and _____ the thickness-adjusting layer of the liquid crystal layer has having an inclined plane in the vicinity of the boundary between the reflective display region and the transmissive display region, and electrodes are being provided on the inner sides of the pair of substrates respectively, with a protrusion being provided at a position corresponding to the inclined plane of the thickness-adjusting layer of the liquid crystal layer on the electrode on the substrate opposite to the side where the thickness-adjusting layer of the liquid crystal layer is provided among the electrodes on the pair of substrates.

3. (Currently Amended) The liquid crystal display device according to Claim 1, further comprising:

wherein, within the single dot region, the transmissive display region is being provided in the center of the dot region, the reflective display region is being provided at the peripheral edge of the dot region to surround the periphery of the transmissive display region, and, among the electrodes on the pair of substrates, an opening is being provided at a position substantially corresponding to the center of the transmissive display region in the electrode on the substrate side where the thickness-adjusting layer of the liquid crystal layer is provided.

4. (Currently Amended) The liquid crystal display device according to Claim 1, further comprising:

wherein, within the single dot region, the transmissive display region is being provided in the center of the dot region, the reflective display region is being provided at the

peripheral edge of the dot region to surround the periphery of the transmissive display region, and, among the electrodes on the pair of substrates, a protrusion is being provided at a position substantially corresponding to the center of the transmissive display region in the electrode on the substrate side where the thickness-adjusting layer of the liquid crystal layer is provided.

5. (Currently Amended) The liquid crystal display device according to Claim 1, wherein color filters are being provided on the inner side of any one of the pair of substrates.

6. (Currently Amended) The liquid crystal display device according to Claim 1, wherein a substantially circular polarized light incidence means is device being provided for making to make substantially circular polarized light incident on each of the pair of substrates.

7. (Currently Amended) An electronic apparatus comprising apparatus, comprising:

_____ a liquid crystal display device according to Claim 1.
